**Title: CampusGuard AI: Suspended Student Detection and Alert System Using
Face Recognition**

ABSTRACT

Manual monitoring for suspended students entering campus is inconsistent and error-prone, while traditional CCTV offers no real-time identification or response. This paper proposes CampusGuard AI, a real-time face recognition system that continuously processes live video, detects faces, and generates embeddings matched against a database of suspended students using similarity-based comparison. Low-confidence matches are logged for future reference, while high-confidence matches trigger an immediate, fully automated email alert to security — without requiring manual approval. Built on a Django backend with a REST API and web dashboard, the system maintains a complete audit log of every detection, including timestamp, confidence score, and post-alert verification status. By combining continuous monitoring with instant automated alerting, CampusGuard AI removes dependency on manual surveillance and offers a scalable, accountable solution for campus access control.

Keywords

Face Recognition, Real-Time Surveillance, Deep Learning, Django, Automated Alert System, Campus Security, Convolutional Neural Networks (CNN).
